

Global Script Caching

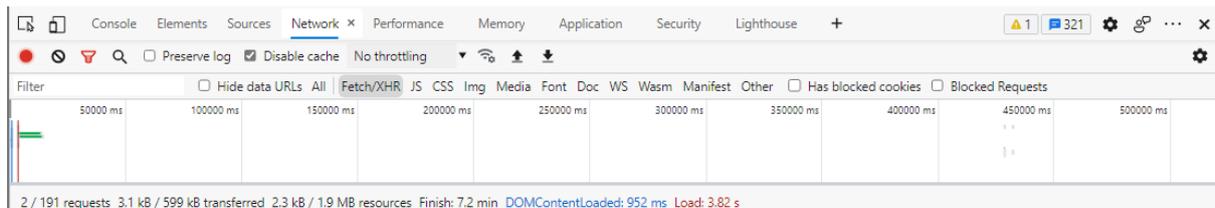

When we're working with global custom scripts (C:\Program Files (x86)\Sage\CRM\CRM\WWWRoot\js\custom\), it is a bit annoying to have to refresh the CRM App Pool or reset IIS in order to be able to test our changes.

Before we go any further, we'll create a small script (zzz_test.js) that we can use to test:

```
crm.ready(  
  function() {  
    alert("Test 1");  
  }  
);
```

In Edge, Chrome and Firefox we can disable 'caching' using the developer tools:

1. Press F12 to open the 'Developer Tools'
2. Select Network.
3. Check 'Disable cache'

N.B. the dev tools must remain open during testing.

To test simply change the alert message and load a new page in CRM to see if the new message comes through.
